Electric charge is the physical property of matter that causes it to experience a force when placed in an electromagnetic field. There are two types of electric charges; positive and negative (commonly carried by protons and electrons respectively).

Kirchhoff's circuit laws are two equalities that deal with the current and potential difference (commonly known as voltage) in the lumped element model of electrical circuits.

Electric cooperatives support legislative and regulatory initiatives that allow them to balance investments in environmental controls and energy efficiency with the need to continue to provide reliable, affordable service to their members.

When one or more of these situations occur a "solid" or "incipient" contact between conductors of different phases or between a conductor and a metallic no-live part can be established, causing a short-circuit, which diagrams are shown in Figure 1.
