In optics, a thin lens is a lens with a thickness (distance along the optical axis between the two surfaces of the lens) that is negligible compared to the radii of curvature of the lens surfaces.

The physical constant  $\epsilon_0$  (pronounced as *epsilon nought* or *epsilon zero*), commonly called the vacuum permittivity, permittivity of free space or electric constant or the distributed capacitance of the vacuum, is an ideal, (baseline) physical constant, which is the value of the absolute dielectric permittivity of classical vacuum.

1.1  $\epsilon_0$  is a physical constant representing the magnitude of the electric force in a vacuum. It is the ratio of the electrostatic force between two charges to the product of the charges. It is a scalar, and its value is approximately  $8.854 \times 10^{-12}$  farads per meter (F/m). It is named after James Clerk Maxwell.

### Free-space laser communication systems

Free-space laser communication systems have the potential to provide flexible, high-speed connectivity suitable for long-haul intersatellite and deep-space links. For these applications,...
