The key tool in this paper is a so-called kernel function, which is a product of 4 elliptic gamma functions. This building block is given by  $G(r;a$

The kernel function method of Bergman and Schiffer (see (1) and (2)) has recently been used by Colton and Gilbert (see (3) and (4)) in connection with approximation theory and the numerical treatment of elliptic differential equations.

the kernel function is a new concept with fundamental properties which have no counterpart in the classical theory of real orthogonal functions. The method of complex orthogonal functions can equally well be applied to
